To improve the availability and reproducibility of work published in the *Journal of Water Resources Planning and Management*, the Editorial Board is initiating a new policy to require authors to specify the availability of data, computational models, code, and other electronic materials used in work submitted for publication. We intend for this new policy to (1) make it easier for readers and others to use, reproduce, and extend published work; (2) increase the quality of submissions; and (3) further encourage people to use work published in the *Journal* and cite that work. We see this new policy as a step forward to allow readers, authors, and our field to practice more open and reproducible science.

When submitting a new manuscript, authors will include a new section titled "Data Availability" before the "Acknowledgments." Within this section, authors will select one or more of the following statements and list specific items as appropriate:

1. The following data, models, or code generated or used during the study are available in a repository or online.

[Provide full citations that include URLs or digital object identifiers (DOIs).]

2. The following data, models, or code used during the study were provided by a third party. (List items.) Direct requests for these materials may be made to the provider as indicated in the "Acknowledgments."
3. The following data, models, or code generated or used during the study are available from the corresponding author by request. (List items.)
4. The following data, models, or code generated or used during the study are proprietary or confidential in nature and may only be provided with restrictions (e.g., anonymized data). (List items and restrictions.)
5. All data, models, and code generated or used during the study appear in the submitted article.
6. No data, models, or code were generated or used during the study (e.g., opinion or dataless paper).

The Editorial Board encourages authors to make material available in a repository and to use a DOI to link to the repository to ensure a more permanent link from the article to the repository long into the future. The Editorial Board also encourages authors to store materials in sites that provide long-term curation. Potential sites include ASCE (as journal supplemental material), an institutional repository, HydroShare, Harvard Dataverse, Figshare, Dryad, or GitHub. Additionally, the repository should provide sufficient metadata and instructions so readers can correctly interpret content, use materials, and reproduce results and figures presented in the published article.

More information on platforms for sharing data and code can be found in the ASCE Library (<https://ascelibrary.org/page/dataavailability>).
